

## Responsive Design Exercise

Create an HTML page with CSS to match the following website design. Your design should be responsive and change to the layout shown in the second figure when the screen is less than 600px. Implement the design first using floats for the columns and menu, then using flexbox, then using grid for the entire layout. EC: Also use Bootstrap's grid for the entire layout. Your mumstudents.org page should have links to each of the different solutions.
